

AUTONOMOUS WEB3 THREAT INTELLIGENCE

Quorum finds the scams. On its own.

An autonomous agent · Emergence CRAFT × Nebius Token Factory

THE PROBLEM

\$17B lost to crypto scams last year.

Finding a single rug takes a compliance analyst **hours**. Millions of tokens, endless new deploys, human teams that can't keep up. Screening is a legal requirement — and today's tooling is dashboards a person has to operate.

WHAT IT IS

An autonomous SOC for Web3.

Detect

Always on

Scores every token itself — no human input.

Investigate

Goes deep

Dispatches itself to threats and writes its own SQL.

Campaigns

Unmasks operators

Resolves the rug-kits behind whole fleets of scams.

Protect

Blocks at the edge

A risk API wallets & exchanges call before every tx.

MONITOR

It's already watching the whole chain.

24.9M

transactions analyzed

65,639

tokens monitored

20.8M

contracts fingerprinted

The autonomous threat feed is the agent's own output — every red row is a token it already distrusts. It dispatches itself to the worst one.

INVESTIGATE

The agent writes its own SQL through CRAFT.

It orients in the semantic layer, then measures holder concentration, deployer dominance, wash-trading, and a lifecycle that spikes and collapses in a day — the pump-then-abandon rug shape. Then a verdict, a risk gauge, and a **shippable detection rule**.

RUG · 95/100

multi-step reasoning

self-correction

THE DISCOVERY

Detection → the whole operation.

15 operators · 319
rugs · 24,639 victims

Quorum entity-resolves all 65k tokens by bytecode fingerprint and unmask the **rug-kits** mass-producing scams — one fingerprint, a whole fleet — as a link chart. Cross-referenced with real rug behavior, so it's defensible.

PROTECT

One API. Every transaction. One word: **BLOCK.**

Wallets, exchanges and protocols call the risk API before every transaction. One integration screens every user, on every token, **automatically** — not one address at a time. This is how it protects at scale.

WHY IT WINS

Great agent. Great product. Real enterprise job.

CRAFT depth – semantic-layer orientation, bytecode clustering, multi-table

Insight – a chain-scale discovery, not "this looks bad"

Agent architecture – self-dispatch, pivot to operator, verify

Story – autonomous SOC, four coherent pillars, live link chart

Reasoning · **Nebius Token Factory**

Data · **Emergence CRAFT**

Twenty-five million transactions.
One word. **Block.**

Quorum — autonomous on-chain threat intelligence.
